

SolaSkirt Silver Installations

SolaSkirt Black is 1.5mm thick aluminium sheet, grade 1050 H14. We brought this option for solar PV systems with silver frames, but it works well with black framed panels as well.

While initially shiny the aluminium will oxidise over time to be closer to the normal silver frame colour of panels. There may also be some small visible scratches which are part of the production process, but we will aim to fit the skirt to minimise seeing these. The clamps for this system are still the same black clamps that we use for SolaSkirt Black installations.

SolaSkirt Silver is 25% cheaper than SolaSkirt Black, and provides a sleek silver trim that not only acts as the strongest pigeon proofing solution on the market, but covers the gaps, wires and rail and gives panels a sleeker, more attractive look.
